Wolverine — Full Review

FORMULA

BPC-157 10mg + TB-500 10mg

What’s in it

PEPTIDE	DOSE	ROLE IN THIS BLEND
BPC-157	10mg	The protective arm. Best known for supporting the gastrointestinal lining, and studied in animal models for tendon, ligament, muscle, and skin repair.
TB-500	10mg	The move-and-build arm. A fragment of thymosin beta-4 that promotes cell migration and new blood vessel formation, thought to bring cells and circulation to where BPC-157’s protective work is happening.

The combination logic

The idea behind combining these two is that they cover different parts of the healing process. BPC-157 is thought to calm inflammation and protect tissue broadly. TB-500 is thought to help cells move to where they’re needed and encourage new blood vessels to form, bringing more blood flow — and more of what a tissue needs to heal — to an injured area. Used together, one is protecting while the other is rebuilding.

Clinical detail: BPC-157’s proposed mechanism centers on upregulation of growth-hormone receptor expression in fibroblasts and modulation of the VEGFR2-Akt-eNOS pathway supporting angiogenesis and cell migration, alongside broad cytoprotective and anti-inflammatory effects. TB-500 (Tβ4 fragment) acts primarily through actin regulation, promoting cell motility, differentiation, and angiogenesis via upregulation of VEGF and matrix metalloproteinases. The two mechanisms are non-overlapping — angiogenic support (TB-500) paired with broader tissue protection and independent pro-angiogenic signaling (BPC-157) — which is the stated rationale for pairing rather than redundancy.

Is there evidence for the combination, or only for the parts?

> Each individual peptide has a body of animal research behind its proposed repair mechanisms. Neither has been tested in a randomized controlled human trial for any indication, and no study — animal or human — has tested this specific two-peptide combination against either peptide alone. The rationale for pairing them is mechanistic (non-overlapping pathways), not the result of a comparative trial. That is not the same as saying it does not work — but it does mean the combination itself is unproven, even where the individual components have supportive animal data.

What it’s used for

USED FOR	EVIDENCE	IN SHORT
Soft-tissue injury recovery	animal_only	The most-studied use for this pairing, though only in animal models — no dedicated human trial of the combination exists.

USED FOR	EVIDENCE	IN SHORT
Tendon, ligament & muscle repair	animal_only	Each peptide individually has animal data supporting connective-tissue repair; no combination-specific human study exists.
Gut lining support	animal_only	Specific to BPC-157's individual research; TB-500 does not carry this use.

Overlaps & stacked risks

- Both peptides carry their individual risk profiles in addition to each other — this is not a case of one offsetting the other's risk.
- TB-500's angiogenic mechanism is a theoretical amplifying factor if any undiagnosed abnormal tissue growth is present.
- Neither peptide has long-term human safety data at any dose, let alone in combination.
- Injection-site reactions are the most commonly reported effect for both peptides individually.

Who it's not for

- Pregnant or breastfeeding patients
- Anyone with a personal or family history of cancer — TB-500's blood-vessel-growth mechanism is a theoretical concern for feeding tumor growth
- Anyone on anticoagulant or antiplatelet medication without provider review
- Competitive athletes subject to anti-doping testing — both peptides are prohibited in-competition

Who it suits

Patients recovering from a soft-tissue injury (tendon, ligament, or muscle) who have discussed the animal-only evidence base with their provider and are not in one of the excluded groups above. Not a substitute for physical therapy, surgical repair where indicated, or a documented recovery plan.

Who makes this, and under what rules

Everything dispensed here is prepared by a licensed 503A compounding pharmacy — not bought from a supplier and repackaged, and not sourced from an online seller.

That designation carries specific, enforceable obligations:

- **A prescription in your name.** Compounded from a prescription for one identified patient, after an evaluation.
- **Licensed and inspected.** A state licence, subject to inspection by the state board of pharmacy.
- **Ingredients that can be traced.** A certificate of analysis from an FDA-registered facility, back to a named source and lot.
- **Sterile preparation to a published standard.** USP standards.
- **A paper trail.** A lot number and beyond-use date on every preparation.

A compounded preparation is not an FDA-approved medicine — but it is the difference between a licensed pharmacy working to a standard and an unregulated website.

This page describes Wolverine for general educational purposes. It is not medical advice and does not replace a consultation with a licensed provider. Individual results vary, and combination products carry the risks of each included peptide.
