METABOLIC & FAT LOSS

Sculpt — Full Review

FORMULA

Tesamorelin 10mg + CJC-1295 6mg + AOD-9604 10mg + MOTS-c 10mg

What's in it

PEPTIDE	DOSE	ROLE IN THIS BLEND
Tesamorelin	10mg	The visceral-fat signal. A GHRH analog with its own FDA-approved history (as Egrifta) — the only ingredient here with regulatory-grade trial data.
CJC-1295	6mg	Extends and smooths the growth-hormone pulse Tesamorelin starts.
AOD-9604	10mg	A different angle — acts on fat cells directly, without touching the GH/IGF-1 axis the other two rely on.
MOTS-c	10mg	The engine-room piece. Keeps mitochondrial output and insulin sensitivity up to match the demand.

The combination logic

The idea is to attack fat loss from more than one direction at once. Tesamorelin and CJC-1295 both work through the growth-hormone system to target stored fat and help protect muscle. AOD-9604 works a different way entirely — it acts directly on fat cells without touching the broader hormone system. MOTS-c supports the cellular energy production needed to keep up with all of that metabolic activity. Clinical detail: Tesamorelin and CJC-1295 are both GHRH analogs that stimulate pulsatile endogenous GH release, supporting lipolysis and IGF-1-mediated lean tissue preservation. AOD-9604, a modified HGH 176-191 fragment, is proposed to stimulate lipolysis and inhibit lipogenesis via beta-adrenergic receptor activity independent of the GH/IGF-1 axis, avoiding the blood-glucose

effects associated with full-length GH. MOTS-c activates AMPK signaling, supporting glucose uptake, fatty-acid oxidation, and mitochondrial biogenesis — proposed to sustain the metabolic throughput the other three components require.

Is there evidence for the combination, or only for the parts? Tesamorelin carries real weight here — it's FDA-approved (as Egrifta) specifically for reducing visceral fat in a defined patient population, backed by controlled trials showing measurable visceral-fat reduction versus placebo. CJC-1295, AOD-9604, and MOTS-c each have laboratory or limited human data for fat metabolism individually, but no FDA approval. No study has tested this specific four-peptide combination against its individual components or against any of them alone. The rationale for combining them is mechanistic — four non-overlapping pathways toward the same goal — not the result of a comparative trial.

What it's used for

USED FOR	IN SHORT
Fat loss, particularly visceral fat	The most consistent rationale across sources for this combination; the components address fat loss through separate, non-competing mechanisms.
Lean-mass preservation during a deficit	CJC-1295 and Tesamorelin both support the GH axis, which is believed to help protect muscle during fat loss.
Metabolic flexibility / insulin sensitivity	MOTS-c's primary studied mechanism; included here to support the metabolic demand the other three ingredients create.

Overlaps & stacked risks

- Stacking four active peptides means the combined side-effect profile of all four, not a reduced one.
- Growth-hormone-axis peptides (Tesamorelin, CJC-1295) can affect insulin sensitivity and glucose metabolism.
- Long-term human safety data does not exist for this combination at any dose.
- Injection-site reactions and transient flushing are the most commonly reported effects across the individual components.

Who it is not for

- Pregnant or breastfeeding patients
- Anyone with active malignancy or a history of cancer without physician clearance

- Patients with diabetes or insulin resistance, without close clinician oversight
- Competitive athletes subject to anti-doping testing — growth-hormone secretagogues are prohibited in-competition

Who it suits

Patients pursuing fat loss — particularly visceral fat — who have discussed the limited combination-specific evidence with their provider, have no contraindicating history, and are not competitive athletes subject to testing. Works best alongside, not instead of, diet and training.

Who makes this, and under what rules

Everything dispensed here is prepared by a licensed 503A compounding pharmacy — not bought from a supplier and repackaged, and not sourced from an online seller. That designation carries specific, enforceable obligations:

- A prescription in your name. Compounded from a prescription for one identified patient, after an evaluation.
- Licensed and inspected. A state licence, subject to inspection by the state board of pharmacy.
- Ingredients that can be traced. A certificate of analysis from an FDA-registered facility, back to a named source and lot.
- Sterile preparation to a published standard. USP standards.
- A paper trail. A lot number and beyond-use date on every preparation.

A compounded preparation is not an FDA-approved medicine — but it is the difference between a licensed pharmacy working to a standard and an unregulated website. This page describes Sculpt for general educational purposes. It is not medical advice and does not replace a consultation with a licensed provider. Individual results vary, and combination products carry the risks of each included peptide.

IMPORTANT SAFETY INFORMATION

Compounded medications offered through FitClinicMD are prescribed only after an individual clinical evaluation by a licensed provider, and are prepared by state-licensed compounding pharmacies. Compounded medications have not been evaluated or approved by the U.S. Food and Drug Administration as safe or effective for the treatment of any condition. Information on this site is for general educational purposes and is not medical advice. You must be 18 or older. Individual results vary. A prescription is issued only if a licensed provider determines it is appropriate for you.
